

Weight

Loss

How compounded medication can help you achieve your personal goals

If you've learned you have a specific issue, weight loss treatments may be your next step. Premier Custom Pharmacy recommends considering these common weight loss treatments, depending on your current weight, other health conditions, and hormone levels.

- **Bupropion/Naltrexone** – Used on-label to combat depression, bupropion can also help balance levels of norepinephrine and dopamine. When taken in combination with naltrexone, these medications can reduce cravings and promote appetite regulation through balancing neurotransmitters.
- **Phentermine/Topiramate** – Both phentermine and topiramate work to help suppress appetite while extending feelings of being full, allowing users to avoid overeating or

eating when not hungry. This combination medication can be dosed at multiple strength levels to accommodate patient needs and limit side effects.

- **Vitamins and Supplements** - Our team of pharmacists can help you find weight loss supplements that may help to boost metabolism and support your weight loss needs.
- **Sermorelin** - This growth-hormone releasing agent is associated with increased metabolism, improved wellbeing, and has other anti-aging benefits.
- **Glycolic acid/Lactic acid** - These medications in combination may help to reduce the appearance of cellulite when used daily.

Here at Premier Custom Pharmacy, we advocate for personal wellness and provide both over the counter and prescription solutions to support weight loss.

Thank you for allowing us to be a part of your therapeutic, healthful regimen. If you have further questions, please contact us.
